1 Question 1

System:

$$\dot{x}(t) = -0.1x(t) + u(t)$$

Subjected to $0 \le u(t) \le M$

1.1 part a

$$J = \int_{0}^{100} -x(t)dt$$

Hamiltonian matrix:

$$\mathcal{H} = g(\vec{x}(t), u(t), t) + \vec{p}(t)^{T} a(\vec{x}(t), u(t), t)$$

$$\mathcal{H} = -x(t) - 0.1 p(t) x(t) + p(t) u(t)$$
(1)

Euler-Lagrange equation:

$$\dot{\vec{x}} = \frac{\partial \mathcal{H}}{\partial \vec{p}} = a(\vec{x}(t), u(t), t)$$
 (2)

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} \tag{3}$$

Now we use above equation for solve problem.

$$-\frac{\partial \mathcal{H}}{\partial x} = 1 + 0.1p$$

There is two differential equation and two unknowns.

$$\dot{x} = -x(t) - 0.1px + pu \tag{4}$$

$$\dot{p} = 1 + 0.1p \tag{5}$$

Equation 5 solved in MATLAB(Q1_a.m) and code attached to file.

$$p(t) = C_1 \exp(t/10) - 10 \tag{6}$$

Final x(t) is free so:

$$\left.h_{\vec{x}}-\vec{p}=\vec{0}\right|_{*,t_f}\to p(t_f)=0$$

Use new boundry condition($p(t_f) = 0$) in equation 6 to find p function(p(t)).

$$p(100) = C_1 \exp(100/10) - 10 = 0 \rightarrow C_1 = 10 \exp(-10)$$

Ali BaniAsad 96108378 1.2 part b

$$p(t) = 10 \exp(0.1(t - 100)) - 10 \tag{7}$$

We know that u(t) has limit so for optimization we have another condition to select u(t) for every time.

$$u(t) = \begin{cases} \frac{\partial \mathcal{H}}{\partial u} & < 0 \quad u(t) = M \\ \frac{\partial \mathcal{H}}{\partial u} & = 0 \quad \mathcal{H} \text{ is not a function of } u(t) \\ \frac{\partial \mathcal{H}}{\partial u} & > 0 \quad u(t) = 0 \end{cases}$$
 (8)

From equation 1 we calculate $\frac{\partial \mathcal{H}}{\partial u}$.

$$\frac{\partial \mathcal{H}}{\partial u} = p(t)$$

From equation 7 we know that at $t_0 \to t_f p(t)$ is less than zero(p(t) < 0), so u(t) for every time is M.

1.2 part b

$$J = \int_0^{100} -x(t)dt$$

Subjected to:

$$\int_0^{100} u(t)dt = K(\text{a known constant})$$

z(t) is new state:

$$z(t) = \int_0^t u(t)dt \to \frac{dz}{dt} = u(t)$$

New differential constraints:

$$\begin{split} \frac{dz}{dt} - u(t) &= 0 \\ g_a(x, \dot{x}, \dot{z}, t, \lambda) &= g(x, \dot{x}, t) + \lambda(t) f(x, \dot{x}, \dot{z}, t) \\ g_a &= -x(t) + \lambda(\dot{z}(t) - u(t)) \end{split}$$

Hamiltonian matrix:

$$\mathcal{H} = g_a(\vec{x}(t), u(t), z(t), \lambda, t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

We assume $p_2 = \lambda$

$$\mathcal{H} = -x(t) - 0.1p_1(t)x(t) + p_1(t)u(t) + p_2(t)(\dot{z}(t) - u(t))$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} = \begin{bmatrix} -\frac{\partial \mathcal{H}}{\partial x} \\ -\frac{\partial \mathcal{H}}{\partial z} \end{bmatrix} = \begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix}$$

$$\begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix} = \begin{bmatrix} 0.1p_1 + 1 \\ 0 \end{bmatrix}$$
(9)

Above equation solved in previous part.

$$\begin{bmatrix} p_1(t) \\ p_2(t) \end{bmatrix} = \begin{bmatrix} 10 \exp(0.1(t-100)) - 10 \\ C_1 \end{bmatrix}$$
(10)

Ali BaniAsad 96108378 1.3 part c

In this part we have the same condition that described in previous in equation 8. From equation 9 we calculate $\frac{\partial \mathcal{H}}{\partial u}$.

$$\frac{\partial \mathcal{H}}{\partial u} = p_1 - p_2 = (10 \exp(0.1(t - 100)) - 10) - C_1$$

From equation 10 we know that C_1 is constant.

There is four scenario for this problem.

- 1. For all the time $(t_0 \to t_f)$ $\frac{\partial \mathcal{H}}{\partial u} > 0$ so u(t) = 0, this scenario maybe possible if K = 0.
- 2. For all the time $(t_0 \to t_f)$ $\frac{\partial \mathcal{H}}{\partial u} < 0$ so u(t) = M, this scenario maybe possible if $K = M \times t_f$.
- 3. For time $(t_0 \to t)$ $\frac{\partial \mathcal{H}}{\partial u} < 0$ and for time $(t \to t_f)$ $\frac{\partial \mathcal{H}}{\partial u} > 0$ so for time $(t_0 \to t)$, u(t) = M and for time $(t \to t_f)$, u(t) = 0 and this scenario maybe possible for $0 \le K \le M \times t_f$.
- 4. For time $(t_0 \to t)$ $\frac{\partial \mathcal{H}}{\partial u} > 0$ and for time $(t \to t_f)$ $\frac{\partial \mathcal{H}}{\partial u} < 0$ so for time $(t_0 \to t)$, u(t) = 0 and for time $(t \to t_f)$, u(t) = M and this scenario is not possible because p_1 is growing by the time and p_2 is constant all the time.

1.3 part c

$$J = -x(100)$$

Subjected to:

$$\int_0^{100} u(t)dt = K(\text{a known constant})$$

z(t) is new state:

$$z(t) = \int_0^t u(t)dt \to \frac{dz}{dt} = u(t)$$

New differential constraints:

$$\frac{dz}{dt} - u(t) = 0$$

$$g_a(x, \dot{x}, \dot{z}, t, \lambda) = g(x, \dot{x}, t) + \lambda(t)f(x, \dot{x}, \dot{z}, t)$$

$$g_a = -x(t) + \lambda(\dot{z}(t) - u(t))$$

Hamiltonian matrix:

$$\mathcal{H} = g_a(\vec{x}(t), u(t), z(t), \lambda, t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

We assume $p_2 = \lambda$

$$\mathcal{H} = -0.1p_{1}(t)x(t) + p_{1}(t)u(t) + p_{2}(t)(\dot{z}(t) - u(t))$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} = \begin{bmatrix} -\frac{\partial \mathcal{H}}{\partial x} \\ -\frac{\partial \mathcal{H}}{\partial z} \end{bmatrix} = \begin{bmatrix} \dot{p}_{1} \\ \dot{p}_{2} \end{bmatrix}$$

$$\begin{bmatrix} \dot{p}_{1} \\ \dot{p}_{2} \end{bmatrix} = \begin{bmatrix} 0.1p_{1} \\ 0 \end{bmatrix}$$

$$(11)$$

$$\begin{bmatrix}
p_1(t) \\
p_2(t)
\end{bmatrix} = \begin{bmatrix}
C_1 \exp(t/10) \\
C_2
\end{bmatrix}$$
(12)

$$h_{\vec{x}} - \vec{p} = \vec{0}\Big|_{*,t_f} \to p_1(t_f) = -1$$
 (13)

From equation 12 and 13 we can find $p_1(t)$ function.

$$p_1(100) = C_1 \exp(100/10) = -1 \to C_1 = -\exp(-10)$$

 $p_1(t) = -\exp(0.1(t - 100))$

This problem is like section 1.2 and have the same scenarios.

2 Question 2

2.1 part a

kir

3 Question 3

$$\ddot{x}(t) = -x(t) - 0.1\dot{x}(t) + u(t), \qquad x(0) = \dot{x}(0) = 1$$

Assume:

$$x_1(t) = x(t), \quad x_2(t) = \dot{x}(t) \to a(\vec{x}, u, t) = \begin{bmatrix} \dot{x}_1(t) \\ \dot{x}_2(t) \end{bmatrix} = \begin{bmatrix} x_2(t) \\ -x_1(t) - 0.1x_2(t) + u(t) \end{bmatrix}$$
$$J = \frac{1}{2}x^T(t_f)Hx(t_f) + \frac{1}{2}\int_0^{t_f} \left(\alpha(x^2 + \dot{x}^2) + \beta u^2\right)dt$$

3.1 part a

 $\alpha = \beta = 1, t_f \to \infty$ and H = 0:

$$J = \frac{1}{2} \int_0^{t_f} (x^2 + \dot{x}^2 + u^2) dt$$
$$\vec{p}(t) = \begin{bmatrix} p_1(t) \\ p_2(t) \end{bmatrix}$$

Hamiltonian matrix:

$$\mathcal{H} = g(\vec{x}(t), u(t), t) + \vec{p}(t)^{T} a(\vec{x}(t), u(t), t)$$

$$\mathcal{H} = x_{1}^{2}(t) + x_{2}^{2}(t) + u^{2}(t) + \left[p_{1}(t) \quad p_{2}(t)\right] \begin{bmatrix} x_{2}(t) \\ -x_{1}(t) - 0.1x_{2}(t) + u(t) \end{bmatrix}$$

$$\mathcal{H} = x_{1}^{2}(t) + x_{2}^{2}(t) + u^{2}(t) + p_{1}(t)x_{2}(t) - p_{2}(t)x_{1}(t) - 0.1p_{2}(t)x_{2}(t) + p_{2}(t)u(t)$$

Euler-Lagrange equation:

$$\dot{\vec{x}} = \frac{\partial \mathcal{H}}{\partial \vec{p}} = a(\vec{x}(t), u(t), t) \tag{14}$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} = \begin{bmatrix} -\frac{\partial \mathcal{H}}{\partial x_1} \\ -\frac{\partial \mathcal{H}}{\partial x_2} \end{bmatrix}$$
(15)

$$\vec{0} = \frac{\partial \mathcal{H}}{\partial \vec{u}} \tag{16}$$

Ali BaniAsad 96108378 3.1 part a

Now we use above equation for solve problem.

$$\begin{bmatrix} -\frac{\partial \mathcal{H}}{\partial x_1} \\ -\frac{\partial \mathcal{H}}{\partial x_2} \end{bmatrix} = \begin{bmatrix} -2x_1 + p_2 \\ -2x_2 - p_1 + 0.1p_2 \end{bmatrix} = \begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix}$$
$$\frac{\partial \mathcal{H}}{\partial \vec{u}} = 2u + p_2 = 0 \to u = -0.5p_2$$

$$\frac{\partial \mathcal{H}}{\partial \vec{u}} = 2u + p_2 = 0 \to u = -0.5p_2$$

There is four differential equation and four unknowns.

$$\dot{x}_1 = x_2 \tag{17}$$

$$\dot{x}_2 = -x_1 - 0.1x_2 - 0.5p_2 \tag{18}$$

$$\dot{p}_1 = -2x_1 + p_2 \tag{19}$$

$$\dot{p}_2 = -2x_2 - p_1 + 0.1p_2 \tag{20}$$
