1 Question 1

System:

$$\dot{x}(t) = -0.1x(t) + u(t)$$

Subjected to $0 \le u(t) \le M$

1.1 part a

$$J = \int_0^{100} -x(t)dt$$

Hamiltonian matrix:

$$\mathcal{H} = g(\vec{x}(t), u(t), t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

$$\mathcal{H} = -x(t) - 0.1p(t)x(t) + p(t)u(t) \tag{1}$$

Euler–Lagrange equation:

$$\dot{\vec{x}} = \frac{\partial \mathcal{H}}{\partial \vec{p}} = a(\vec{x}(t), u(t), t) \tag{2}$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} \tag{3}$$

Now we use above equation for solve problem.

$$-\frac{\partial \mathcal{H}}{\partial x} = 1 + 0.1p$$

There is two differential equation and two unknowns.

$$\dot{x} = -x(t) - 0.1px + pu \tag{4}$$

$$\dot{p} = 1 + 0.1p \tag{5}$$

Equation 5 solved in MATLAB(Q1_a.m) and code attached to file.

$$p(t) = C_1 \exp(t/10) - 10 \tag{6}$$

Final $x(t)$ is free so:

$$h_{\vec{x}} - \vec{p} = \vec{0}\Big|_{*,t_f} \rightarrow p(t_f) = 0$$

Use new boundry condition($p(t_f) = 0$) in equation 6 to find p function($p(t)$).

$$p(100) = C_1 \exp(100/10) - 10 = 0 \rightarrow C_1 = 10 \exp(-10)$$

1

$$p(t) = 10 \exp \left(0.1(t - 100)\right) - 10 \tag{7}$$

We know that $u(t)$ has limit so for optimization we have another condition to select $u(t)$ for every time.

$$u(t) = \begin{cases} \dfrac{\partial \mathcal{H}}{\partial u} & < 0 & u(t) = M \\[2mm] \dfrac{\partial \mathcal{H}}{\partial u} & = 0 & \mathcal{H} \text{ is not a function of } u(t) \\[2mm] \dfrac{\partial \mathcal{H}}{\partial u} & > 0 & u(t) = 0 \end{cases} \tag{8}$$

From equation 1 we calculate $\dfrac{\partial \mathcal{H}}{\partial u}$.

$$\frac{\partial \mathcal{H}}{\partial u} = p(t)$$

From equation 7 we know that at $t_0 \to t_f$ $p(t)$ is less than zero($p(t) < 0$), so $u(t)$ for every time is M.

1.2   part b

$$J = \int_0^{100} -x(t) dt$$

Subjected to:

$$\int_0^{100} u(t) dt = K(\text{a known constant})$$

$z(t)$ is new state:

$$z(t) = \int_0^t u(t) dt \to \frac{dz}{dt} = u(t)$$

New differential constraints:

$$\frac{dz}{dt} - u(t) = 0$$

$$g_a(x, \dot{x}, \dot{z}, t, \lambda) = g(x, \dot{x}, t) + \lambda(t) f(x, \dot{x}, \dot{z}, t)$$

$$g_a = -x(t) + \lambda(\dot{z}(t) - u(t))$$

Hamiltonian matrix:

$$\mathcal{H} = g_a(\vec{x}(t), u(t), z(t), \lambda, t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

We assume $p_2 = \lambda$

$$\mathcal{H} = -x(t) - 0.1 p_1(t) x(t) + p_1(t) u(t) + p_2(t)(\dot{z}(t) - u(t)) \tag{9}$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} = \begin{bmatrix} -\dfrac{\partial \mathcal{H}}{\partial x} \\[3mm] -\dfrac{\partial \mathcal{H}}{\partial z} \end{bmatrix} = \begin{bmatrix} \dot{p}_1 \\[2mm] \dot{p}_2 \end{bmatrix}$$

$$\begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix} = \begin{bmatrix} 0.1 p_1 + 1 \\ 0 \end{bmatrix}$$

Above equation solved in previous part.

$$\begin{bmatrix} p_1(t) \\ p_2(t) \end{bmatrix} = \begin{bmatrix} 10 \exp \left(0.1(t - 100)\right) - 10 \\ C_1 \end{bmatrix} \tag{10}$$

In this part we have the same condition that described in previous in equation 8. From equation 9 we calculate $\dfrac{\partial \mathcal{H}}{\partial u}$.

$$\frac{\partial \mathcal{H}}{\partial u} = p_1 - p_2 = (10 \exp{(0.1(t - 100))} - 10) - C_1$$

From equation 10 we know that C_1 is constant.

There is four scenario for this problem.

1. For all the time$(t_0 \rightarrow t_f)$ $\dfrac{\partial \mathcal{H}}{\partial u} > 0$ so $u(t) = 0$,this scenario maybe possible if $K = 0$.

2. For all the time$(t_0 \rightarrow t_f)$ $\dfrac{\partial \mathcal{H}}{\partial u} < 0$ so $u(t) = M$,this scenario maybe possible if $K = M \times t_f$.

3. For time$(t_0 \rightarrow t)$ $\dfrac{\partial \mathcal{H}}{\partial u} < 0$ and for time$(t \rightarrow t_f)$ $\dfrac{\partial \mathcal{H}}{\partial u} > 0$ so for time$(t_0 \rightarrow t)$, $u(t) = M$ and for time$(t \rightarrow t_f)$, $u(t) = 0$ and this scenario maybe possible for $0 \leq K \leq M \times t_f$.

4. For time$(t_0 \rightarrow t)$ $\dfrac{\partial \mathcal{H}}{\partial u} > 0$ and for time$(t \rightarrow t_f)$ $\dfrac{\partial \mathcal{H}}{\partial u} < 0$ so for time$(t_0 \rightarrow t)$, $u(t) = 0$ and for time$(t \rightarrow t_f)$, $u(t) = M$ and this scenario is not possible because p_1 is growing by the time and p_2 is constant all the time.

1.3   part c

$$J = -x(100)$$

Subjected to:

$$\int_0^{100} u(t)dt = K(\text{a known constant})$$

$z(t)$ is new state:

$$z(t) = \int_0^t u(t)dt \rightarrow \frac{dz}{dt} = u(t)$$

New differential constraints:

$$\frac{dz}{dt} - u(t) = 0$$

$$g_a(x, \dot{x}, \dot{z}, t, \lambda) = g(x, \dot{x}, t) + \lambda(t)f(x, \dot{x}, \dot{z}, t)$$

$$g_a = -x(t) + \lambda(\dot{z}(t) - u(t))$$

Hamiltonian matrix:

$$\mathcal{H} = g_a(\vec{x}(t), u(t), z(t), \lambda, t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

We assume $p_2 = \lambda$

$$\mathcal{H} = -0.1p_1(t)x(t) + p_1(t)u(t) + p_2(t)(\dot{z}(t) - u(t)) \tag{11}$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} = \begin{bmatrix} -\dfrac{\partial \mathcal{H}}{\partial x} \\[2mm] -\dfrac{\partial \mathcal{H}}{\partial z} \end{bmatrix} = \begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix}$$

$$\begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix} = \begin{bmatrix} 0.1p_1 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} p_1(t) \\ p_2(t) \end{bmatrix} = \begin{bmatrix} C_1 \exp(t/10) \\ C_2 \end{bmatrix} \tag{12}$$

Final $x(t)$ is free so:

$$h_{\vec{x}} - \vec{p} = \vec{0}\Big|_{*,t_f} \to p_1(t_f) = -1 \tag{13}$$

From equation 12 and 13 we can find $p_1(t)$ function.

$$p_1(100) = C_1 \exp(100/10) = -1 \to C_1 = -\exp(-10)$$

$$p_1(t) = -\exp(0.1(t - 100))$$

This problem is like section 1.2 and have the same scenarios.

2 Question 2

2.1 part a

Dynamic of system:

$$\ddot{x}(t) = \frac{T}{M}\cos(\beta(t)), \quad \ddot{y}(t) = \frac{T}{M}\sin(\beta(t))$$

Now we define new states:

$$x_1(t) = x(t), \quad x_2(t) = \dot{x_1}(t), \quad x_3(t) = y(t), \quad x_4(t) = \dot{x_3}(t), \quad u(t) = \beta(t)$$

New dynamic of system:

$$a(x(\vec{t}), u, t) = \begin{bmatrix} \dot{x}_1(t) \\ \dot{x}_2(t) \\ \dot{x}_3(t) \\ \dot{x}_4(t) \end{bmatrix} = \begin{bmatrix} x_2(t) \\ \dfrac{T}{M}\cos(u(t)) \\ x_4(t) \\ \dfrac{T}{M}\sin(u(t)) \end{bmatrix}$$

2.2 part b

For minimum time:

$$J = t_f - t_0 = \int_{t_0}^{t_f} dt$$

Hamiltonian matrix:

$$\mathcal{H} = g(\vec{x}(t), u(t), t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

$$\mathcal{H} = 1 + \begin{bmatrix} p_1(t) & p_2(t) & p_3(t) & p_4(t) \end{bmatrix} \begin{bmatrix} x_2(t) \\ \dfrac{T}{M}\cos(u(t)) \\ x_4(t) \\ \dfrac{T}{M}\sin(u(t)) \end{bmatrix}$$

$$\mathcal{H} = 1 + p_1(t)x_2(t) + \frac{T}{M}p_2(t)\cos(u(t)) + p_3(t)x_4(t) + \frac{T}{M}p_4(t)\sin(u(t)) \tag{14}$$

Euler–Lagrange equation:

$$\dot{\vec{x}} = \frac{\partial \mathcal{H}}{\partial \vec{p}} = a(\vec{x}(t), u(t), t) \tag{15}$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} \tag{16}$$

$$\vec{0} = \frac{\partial \mathcal{H}}{\partial \vec{u}} \tag{17}$$

Now we use equation 14 to solve Euler-Lagrange equation.

$$\begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \\ \dot{p}_3 \\ \dot{p}_4 \end{bmatrix} = \begin{bmatrix} -\dfrac{\partial \mathcal{H}}{\partial x_1} \\ -\dfrac{\partial \mathcal{H}}{\partial x_2} \\ -\dfrac{\partial \mathcal{H}}{\partial x_3} \\ -\dfrac{\partial \mathcal{H}}{\partial x_4} \end{bmatrix} = \begin{bmatrix} 0 \\ -p_1 \\ 0 \\ -p_3 \end{bmatrix} \tag{18}$$

Solution of equation 18 is:

$$\begin{bmatrix} p_1(t) \\ p_2(t) \\ p_3(t) \\ p_4(t) \end{bmatrix} = \begin{bmatrix} C_1 \\ -C_1 t + C_2 \\ C_3 \\ -C_3 t + C_4 \end{bmatrix} \tag{19}$$

From Euler-Lagrange equation:

$$\vec{0} = \frac{\partial \mathcal{H}}{\partial \vec{u}} \rightarrow p_4 \cos(u) = p_2 \sin(u) \rightarrow u(t) = \tan^{-1}\left(\frac{p_4(t)}{p_2(t)}\right)$$

Boundary conditions:

$$t_0 = 0, \quad t_f = \text{free}$$

$$\vec{x}(0) = \begin{bmatrix} x_1(0) \\ x_2(0) \\ x_3(0) \\ x_4(0) \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \quad \vec{x}(t_f) = \begin{bmatrix} x_1(t_f) \\ x_2(t_f) \\ x_3(t_f) \\ x_4(t_f) \end{bmatrix} = \begin{bmatrix} \text{Free} \\ V \\ D \\ 0 \end{bmatrix} (D, v \text{ Are known constant})$$

Final time is free so:

$$(\mathcal{H} + h_t)|_{*,t_f} = 0 \rightarrow \mathcal{H}|_{*,t_f} = 0$$

Final x_1 is free so:

$$(\frac{\partial h}{\partial x_1} - p_1)\bigg|_{*,t_f} = 0 \rightarrow p_1(t_f) = 0 \tag{20}$$

3   Question 3

$$\ddot{x}(t) = -x(t) - 0.1\dot{x}(t) + u(t), \qquad x(0) = \dot{x}(0) = 1$$

Assume:

$$x_1(t) = x(t), \quad x_2(t) = \dot{x}(t) \rightarrow a(\vec{x}, u, t) = \begin{bmatrix} \dot{x}_1(t) \\ \dot{x}_2(t) \end{bmatrix} = \begin{bmatrix} x_2(t) \\ -x_1(t) - 0.1x_2(t) + u(t) \end{bmatrix}$$

$$J = \frac{1}{2}x^T(t_f)Hx(t_f) + \frac{1}{2}\int_0^{t_f} \left(\alpha(x^2 + \dot{x}^2) + \beta u^2)\right) dt$$

3.1   part a

$\alpha = \beta = 1$, $t_f \to \infty$ and $H = 0$:

$$J = \frac{1}{2} \int_0^{t_f} (x^2 + \dot{x}^2 + u^2) dt$$

$$\vec{p}(t) = \begin{bmatrix} p_1(t) \\ p_2(t) \end{bmatrix}$$

Hamiltonian matrix:

$$\mathcal{H} = g(\vec{x}(t), u(t), t) + \vec{p}(t)^T a(\vec{x}(t), u(t), t)$$

$$\mathcal{H} = x_1^2(t) + x_2^2(t) + u^2(t) + \begin{bmatrix} p_1(t) & p_2(t) \end{bmatrix} \begin{bmatrix} x_2(t) \\ -x_1(t) - 0.1x_2(t) + u(t) \end{bmatrix}$$

$$\mathcal{H} = x_1^2(t) + x_2^2(t) + u^2(t) + p_1(t)x_2(t) - p_2(t)x_1(t) - 0.1p_2(t)x_2(t) + p_2(t)u(t)$$

Euler–Lagrange equation:

$$\dot{\vec{x}} = \frac{\partial \mathcal{H}}{\partial \vec{p}} = a(\vec{x}(t), u(t), t) \tag{21}$$

$$\dot{\vec{p}} = -\frac{\partial \mathcal{H}}{\partial \vec{x}} = \begin{bmatrix} -\dfrac{\partial \mathcal{H}}{\partial x_1} \\ -\dfrac{\partial \mathcal{H}}{\partial x_2} \end{bmatrix} \tag{22}$$

$$\vec{0} = \frac{\partial \mathcal{H}}{\partial \vec{u}} \tag{23}$$

Now we use above equation for solve problem.

$$\begin{bmatrix} -\dfrac{\partial \mathcal{H}}{\partial x_1} \\ -\dfrac{\partial \mathcal{H}}{\partial x_2} \end{bmatrix} = \begin{bmatrix} -2x_1 + p_2 \\ -2x_2 - p_1 + 0.1p_2 \end{bmatrix} = \begin{bmatrix} \dot{p}_1 \\ \dot{p}_2 \end{bmatrix}$$

$$\frac{\partial \mathcal{H}}{\partial \vec{u}} = 2u + p_2 = 0 \to u = -0.5p_2$$

There is four differential equation and four unknowns.

$$\dot{x}_1 = x_2 \tag{24}$$
$$\dot{x}_2 = -x_1 - 0.1x_2 - 0.5p_2 \tag{25}$$
$$\dot{p}_1 = -2x_1 + p_2 \tag{26}$$
$$\dot{p}_2 = -2x_2 - p_1 + 0.1p_2 \tag{27}$$
